10. Predict how each of the following changes affect the amount of $\mathrm{H}_{2}$ present in an equilibrium mixture in the reaction

$$
3 \mathrm{Fe}(\mathrm{~s})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \rightleftharpoons \mathrm{Fe}_{3} \mathrm{O}_{4}(\mathrm{~s})+4 \mathrm{H}_{2}(\mathrm{~g}) \quad \Delta \mathrm{H}=-150 \mathrm{~kJ}
$$

a) Raising the temperature of the mixture.

Since reaction is exothermic, raising temperature will shift the equilibrium to the left $(\leftarrow)$ and reduce amount of hydrogen.
b) Adding more $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$.

Adding more water, will shift the equilibrium to the right ( $\rightarrow$ ) and increase the amount of hydrogen.
c) Doubling the volume of the container holding the mixture.

Increasing the volume of the container will reduce the pressure but the equilibrium will not be affected, and the amount of hydrogen will not change.
d) Adding a catalyst.

Adding catalyst does not alter the equilibrium and the amount of hydrogen produced.
